

Data Cleaning

1. Checked for duplicates in OrderID and CustomerID. There were no duplicates.
2. Changed the data type of unit price & Total revenue from General to Dollars
3. Changed the title of Total Price to revenue since (price * quantity) is referred to as revenue.
4. Replace missing values in the coupon code using the IF & ISBLANK function with “Unspecified” since there is no access to the organization to provide us the data of customers with missing coupon code. I assumed that customers with missing coupon code probably skipped it unconsciously.
5. Changed the data type of Products, payment method, order status, coupon code, and referral source from “General” to “Text”.
6. Changed the data type of Qty and items in cart from “General” to “Number”.
7. Changed the data type of “Date” from “Custom” to “Date”.
8. Added a table format to the whole dataset.
9. Verified the accuracy of the total revenue provided in the dataset by multiplying the price with the quantity.

Customer ID & OrderID	No duplicates	Preserved 1,200 records	
Data Type	Changed the data type for 4 columns	To allow the data base process the data correctly	Resolved

Tale formatting	Added a table formatting	To enhance visibility	Resolved
Calculation	Verified the accuracy of the calculation	To prevent costly data and enhance reliable data.	Resolved
